

Name: Otniel Nguehou, Vivian Wright

Last four digits of your student ID:

Student: **Fill in the 3-bit code you assigned to each operation.** You will only be entering values in cells outlined in red. The grading staff will choose values for the remaining inputs to use as an arbitrary test of your arithmetic circuit logic. **You will not be filling in all of the rows** – the 2nd half of the table lists the elective operations; **you will only fill in codes for the operations that you implemented.** Do NOT change the order of the rows.

GTA: The logic switches on the DE10-Lite Board control operands A and B and the operation selection. SW[2:0] select OpA from the eight data values stored in the rom. SW[5:3] select OpB from the same eight values. SW[9:7] select the operation. The operation codes were assigned by the student. Record the result.

LEAVE THESE COLUMNS BLANK					COMPLETE THIS COLUMN	LEAVE BLANK
SW[2:0]		SW[5:3]			SW[9:7]	LED[7:0]
addrA (in binary)	OpA (in hex)	addrB (in binary)	OpB (in hex)	operation	operation code (in binary)	result (in hex)
0 0 0				movA	0 0 0	__ __
0 0 1				movA		__ __
Grader: If student's ID is not correctly displayed, stop here. Do not continue the validation						
0 1 0		1 0 1		add	0 0 1	__ __
1 0 0		0 1 0		sub	0 1 0	__ __
For the remaining rows: 1) Enter the 3-bit codes for the operations you implemented, 2) Do NOT change the order of the rows.						
1 1 1				inc3A		__ __
1 0 1				negA	0 1 1	__ __
1 1 0				decA		__ __
0 1 1		1 0 0		subBA	1 0 1	__ __
		1 1 0		incB		__ __
		0 1 1		negB	1 0 0	__ __
		1 1 1		dec2B	__ __ __	__ __

Grader comments (only required if something is unusual or wrong):
